AI GOVERNANCE POLICY

Document ID: DOC-023 | Version: 1.0 | Effective: 2026-01-01 | Status: ACTIVE | Type: Corporate Policy

1. Purpose

Establish governance requirements for selecting, approving, and using AI systems in enterprise work while preserving human accountability, information protection, and traceability.

2. Permitted business use

Employees may use approved AI tools for legitimate business purposes within the approved use case and data classification. Approval of a tool does not automatically approve every data type or business decision.

3. AI analysis of supplier contracts

AI may be used to summarize or analyze supplier contracts only when the tool and use case are approved, applicable confidentiality requirements are satisfied, and the output is treated as analytical support rather than authoritative legal interpretation.

4. Supplier data and approvals

Use of supplier data in AI requires an approved AI tool/use case, compliance with the Data Sharing Policy and Information Security Policy, and the approvals applicable to the data classification. Confidential supplier data additionally requires Information Security and AI Governance approval as defined by the Approval Authority Matrix.

5. New AI tools

A new AI tool that processes enterprise or supplier data requires approval by the AI Governance Owner, with Information Security and Procurement review. Additional review may be required for legal, privacy, regulated, or high-impact use cases.

6. Human accountability

AI-generated analysis or recommendations do not transfer decision accountability from the authorized human role. Decisions requiring formal approval remain subject to the relevant authority matrix and business policy.

7. Training

Users must complete the required AI workforce training before using approved AI tools for enterprise work and must complete role-specific modules when assigned.
